

Hardware-In-Loop Testing of Phasor Measurement Unit using Miniature Full Spectrum Simulator

Rathin Dholakia

Guided By:

Prof. M. C. Chandorkar

Oct 27, 2016

MTP Stage - 1

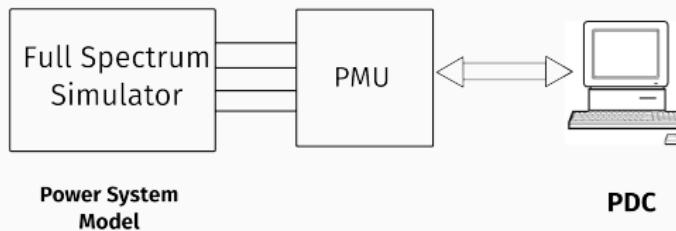

Introduction

Overview

1. Theoretical background
2. Literature Survey
3. Proposed Scheme
4. Implementation
5. Plan of work

Aim of Project

- Test the feasibility of using Full Spectrum Simulator (FSS) as a test bench for PMU testing
- Test PMU device compliance as per IEEE C37.118.1 standard

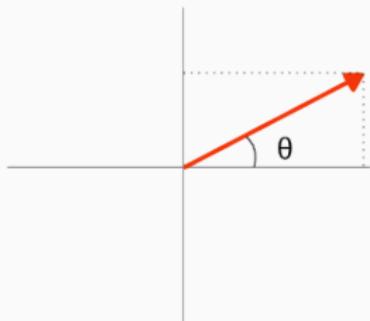

- Implement a power system model having different test case scenarios in FSS
- To use indigenously developed or self-designed PMU hardware
- Evaluate the performance of FSS and PMU both

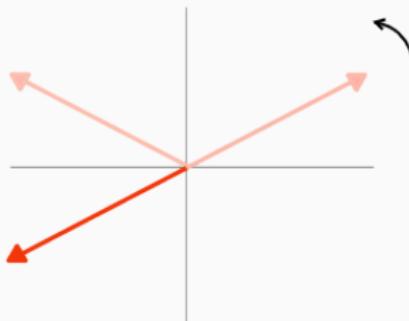

Background - Terms

C37.118 It is a synchrophasor standard stating the measurement provisions, performance criterion and data communication protocol.

- **Phasors:** A complex number which represents both magnitude and phase of an AC quantity.
- **Synchrophasors:** Synchronized sampling/measurement of phasor at a precise reference (time)

Phasor

Time Varying Phasor
(Synchrophasor)

Background - PMU Basics

PMU: It is a device which gives you an estimate of the phasor

Figure 1: Sine to Circle representation [2]

Sinusoid: $x(t) = X_m \cos(\omega t + \varphi)$

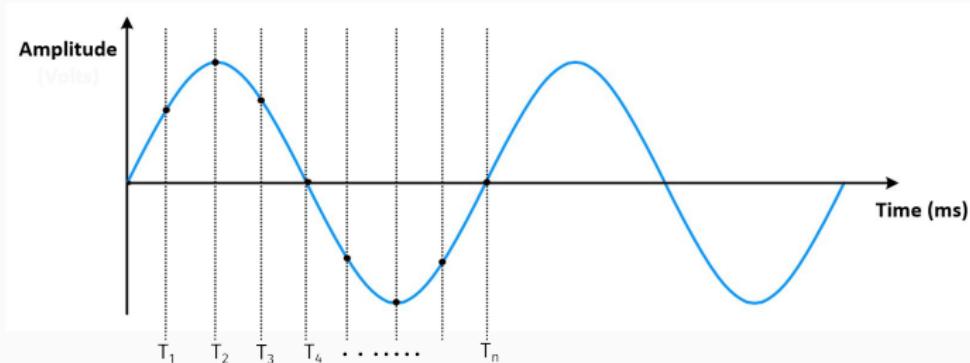

Phasor Representation: $\mathbf{X} = \frac{X_m}{\sqrt{2}} e^{j\phi}$ or $\mathbf{X} = X_r + jX_i$

Frequency $f(t) = \frac{1}{2\pi} \frac{d\psi(t)}{dt}$

ROCOF $= df(t)/dt$

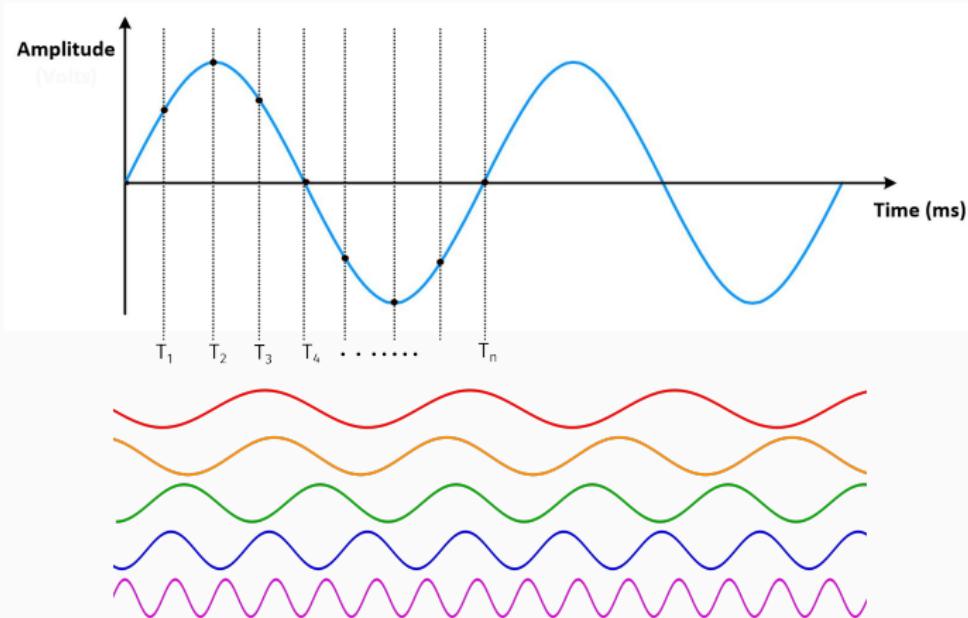

Why Standards are required?

All previous equations are frequency dependent - f_0 - Fundamental frequency

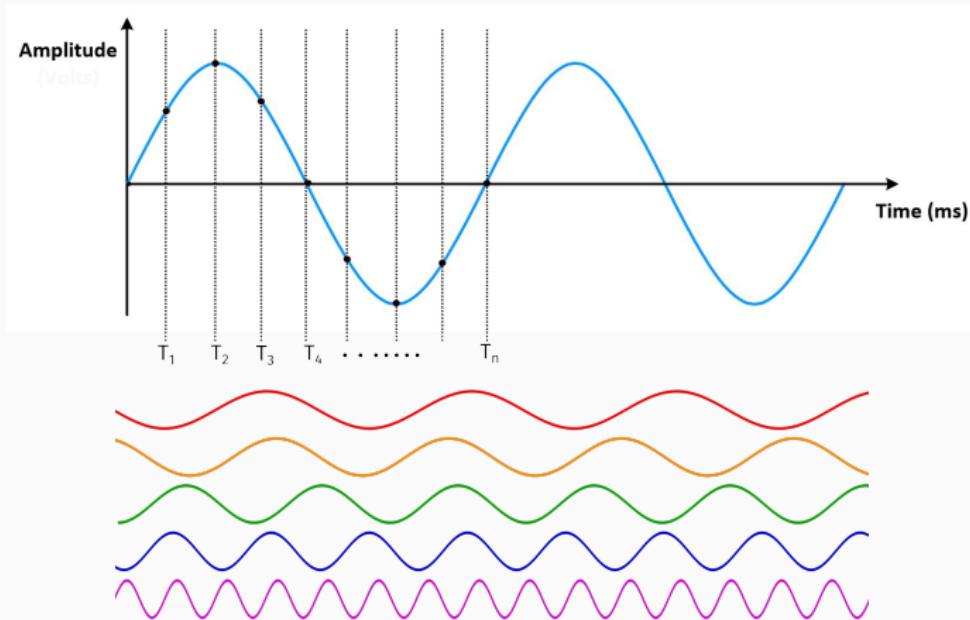

Why Standards are required?

All previous equations are frequency dependent - f_0 - Fundamental frequency

Why Standards are required?

All previous equations are frequency dependent - f_0 - Fundamental frequency

Different make - Incompatibility

Total Vector Error

- Two quantities to observe - Amplitude & Phase
- Frequency dependency of the result
- It require a reference which is independent and time invariant.

Total Vector Error

- Two quantities to observe - Amplitude & Phase
- Frequency dependency of the result
- It require a reference which is independent and time invariant.
- **Total Vector Error (TVE)**

$$TVE(n) = \sqrt{\frac{(\hat{X}_r(n) - X_r(n))^2 + (\hat{X}_i(n) - X_i(n))^2}{X_r(n)^2 + X_i(n)^2}}$$

Total Vector Error

- Two quantities to observe - Amplitude & Phase
- Frequency dependency of the result
- It require a reference which is independent and time invariant.
- **Total Vector Error (TVE)**

$$TVE(n) = \sqrt{\frac{(\hat{X}_r(n) - X_r(n))^2 + (\hat{X}_i(n) - X_i(n))^2}{X_r(n)^2 + X_i(n)^2}}$$

Type of PMU:

-Protection Class: Time critical application, More stringent requirement

-Measurement Class: Greater precision not (very) time critical

Types of Tests

To find the TVE, compliance test(s) are performed, recommended by C37.118

1. Steady-state compliance
 - 1.1 Steady-state synchrophasor measurement requirements
 - 1.2 Steady-state frequency and ROCOF measurement requirements
2. Dynamic compliance
 - 2.1 Synchrophasor measurement bandwidth requirements using modulated test signals
 - 2.2 Frequency ramp test
 - 2.3 Step changes in phase and magnitude

Literature Survey

Literature Survey

Basically there are 3 components in any test arrangement

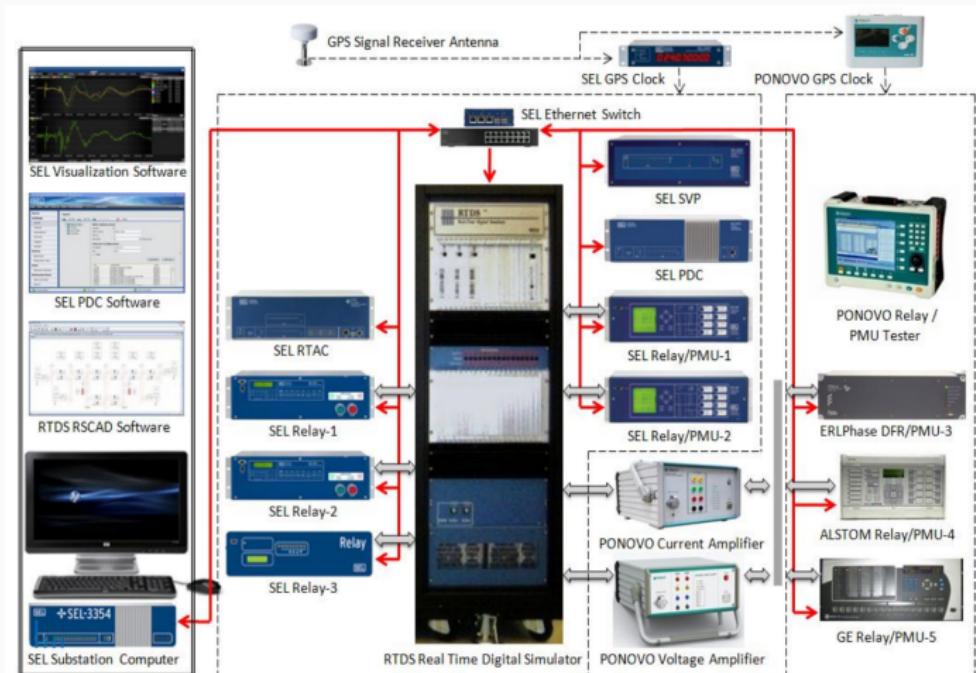

- Device Generating Test Signal
- PMU under test
- Recording device (PDC etc.)

Dynamic PMU Compliance Test under C37.118.1a-2014¹

- Doble F6150 Power System Simulator
- Three Different PMUs
- Direct PMU - Power Sys Simulator interfacing
- Test Performed [6] :
 - Amplitude Modulation: 0.9 - 1.1 PU (0.1 to 5 Hz)
 - Phase Modulation: 0.1 rad
 - Ampli. Step Test: ± 0.1 PU step
 - Phase Step Test:
 - Freq. Ramp: ± 1 Hz/s between (44 to 55 Hz)
- IMP: Test signals are **not** time synchronised.

Development of a Smart Grid Test Bed and Applications in PMU and PDC Testing³

- Test signals are GPS synchronised
- Multiple devices acting as PMU - Multi-vendor relays
- Results validated by PMU Tester

³Saugata S. Biswas, Jeong Hun Kim, Anurag K Srivastava Development of a Smart Grid Test Bed and Applications in PMU and PDC Testing

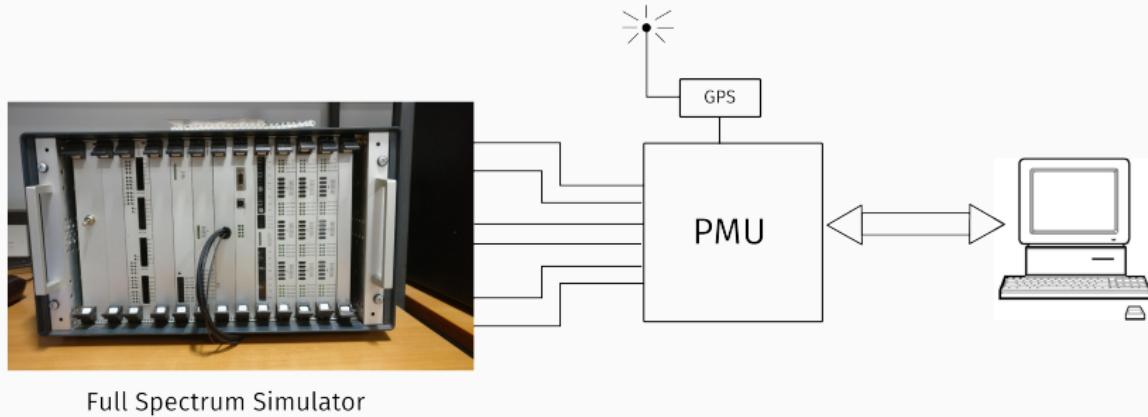

Dynamic Performance Evaluation and Testing of PMU under C.31.118-2011⁴

- Doble F6150 Power System Simulator
- TESLA 4000 PMU
- Direct PMU-RTDS interfacing
- Testing Steps:
 - PSCAD/EMTDC generates precise current and voltage signals
 - Power System Sim. plays it in realtime
 - Test signals are time synchronised
 - The M class operating range is considered, as P class is subset of M.

Implementation

Test Setup

- Use Full Spectrum Simulator
- Develop PMU using OMAP-L137 EVM
- Use **iPDC** in a PC

Full Spectrum Simulator

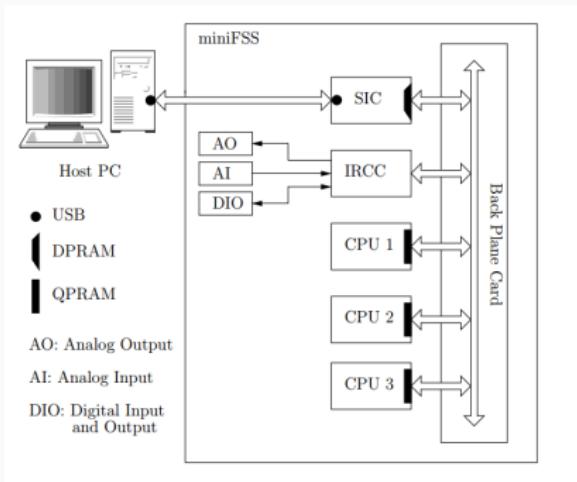

Figure 2: FSS Architecture

- Card Based Structure
- System Interface Card (SIC)
- Intra Rack Control Card (IRC Card)
- Three CPU Cards, each having 3 DSPs. So total 9 processors
- One Analog Input Card (± 10 V)
- One Analog Output Card (± 10 V)
- Digital I/O Card (0 – 5 V)

PMU Architecture - Platform

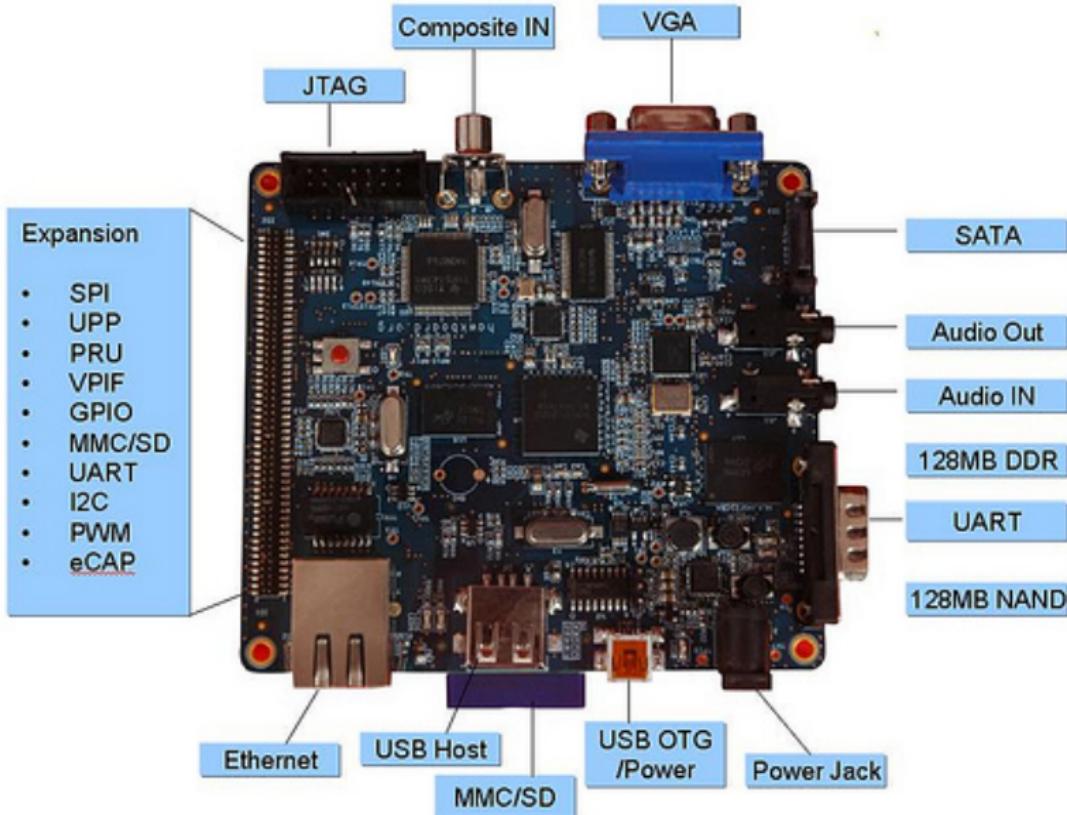

We require a platform which can do two things

- High speed -Digital signal processing
- Upper level tasks - packet forming, Time stamping, ethernet communication

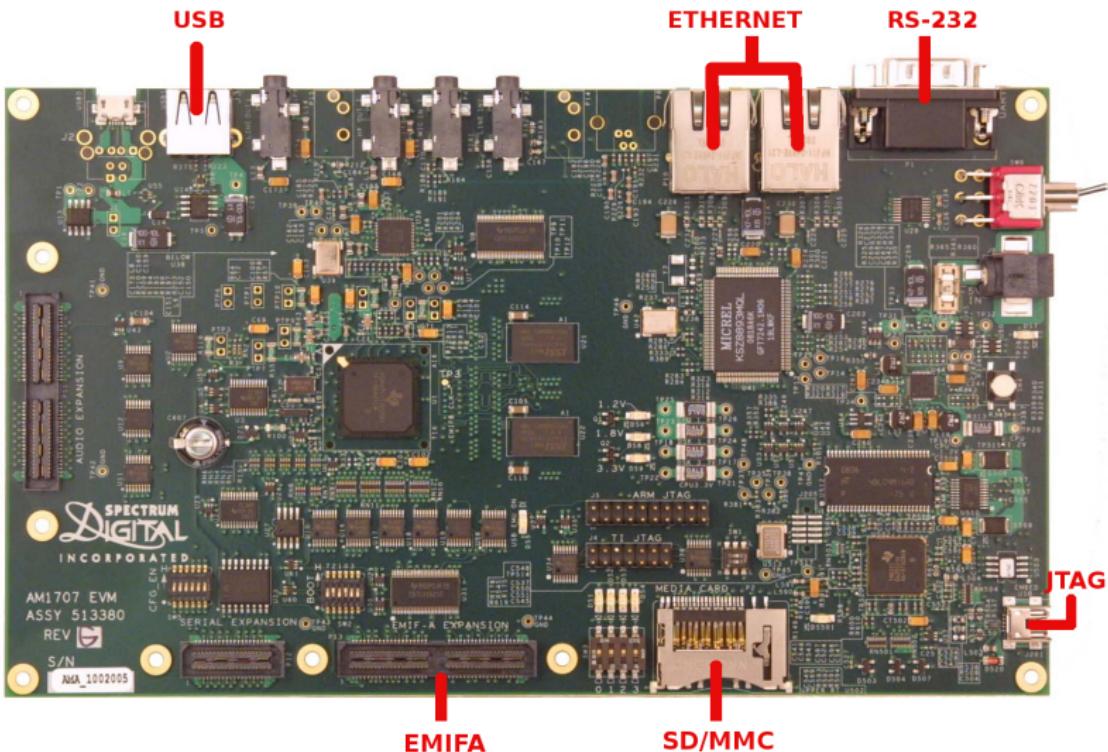

Hence an asymmetric dual core processor - DSP + ARM

- OMAPM L-137 or L-138 (C6747 DSP + ARM 926EJ)
- Hawk-Board V/s Omap-L137 Evaluation Module

PMU Architecture - Platform

PMU Architecture - OMAP L137 EVM

PMU Architecture - ADC Board

For sensing supply inputs we require ADCs which should have:

- Good sampling rate: ~ 200 Samples/Sec
- No of channels: $3 + 3 = 6$ ($3 - \phi$ voltage and current)
- Interfacing type: It should be memory addressable and voltage level compatible to the EVM.
- Input type: FSS analog output is differential which can be configured as single ended, its voltage level is $\pm 10V$

PMU Architecture - ADC Board

- Out of several options we have narrowed down to **AD7606** or **AD7864**
- AD7864 was chosen has following specification
 - High speed ($1.65 \mu\text{s}$) 12-bit ADC
 - 4 simultaneously sampled inputs
 - $0.35 \mu\text{s}$ track-and-hold acquisition time
 - $1.65 \mu\text{s}$ conversion time per channel
 - HW/SW select of channel sequence for conversion
 - $\pm 10\text{V}$ & $\pm 5\text{V}$ operation
 - Special Interfacing arrangement for 3 V processor

PMU Architecture - EMIFA

EMIF-A controller is a 16-bit databus based versatile controller [10], designed to interact with variety of devices like

- Single Data Rate (SDR) RAM
- Asynchronous devices like NAND & NOR flash memory and SRAM

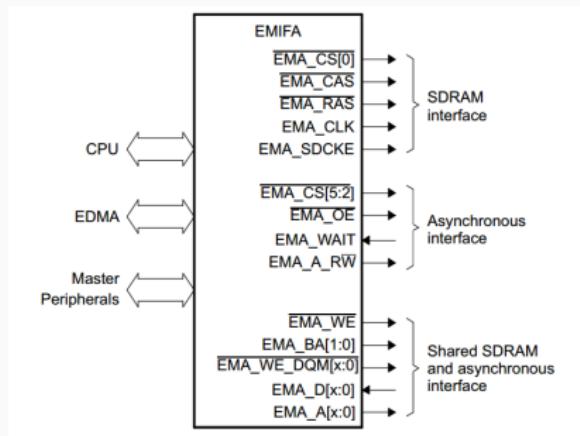

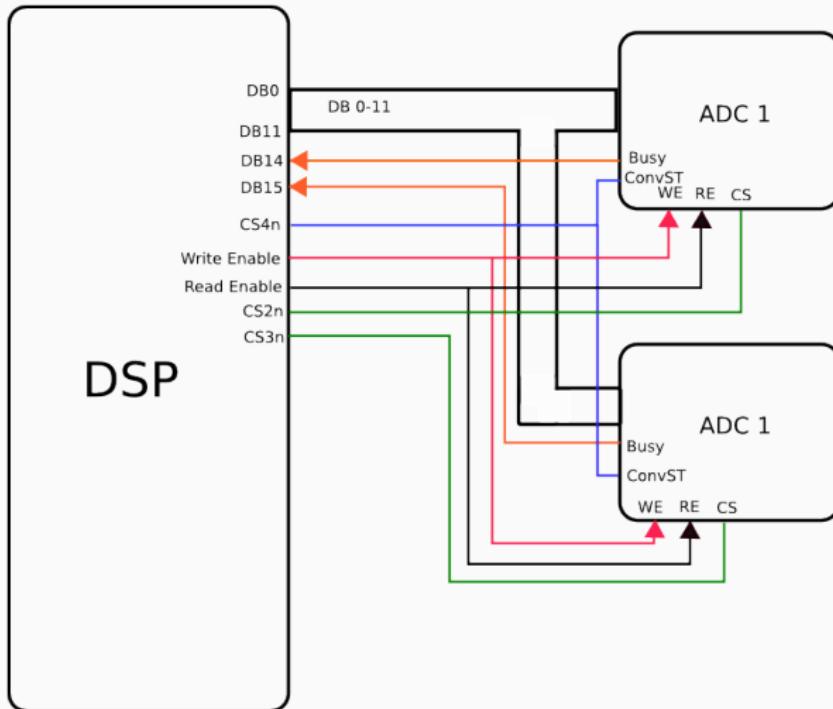

Figure 3: EMIFA Block Diagram

Lot of features to ease and facilitate the usage of asynchronous devices

PMU Architecture - ADC board Arrangement

Future Scope

- Test ADC board, check its performance after connecting it with OMAP-L137 EVM.
- Interfacing of GPS module and DSP programming for time based signal sampling.
- Implement and test DFT algorithm for the phasor estimation and reconstruction.
- Testing of whole setup along with simple test input from FSS.
- Test PMU setup using FSS as real time player and analyse the result.
- Implement a test system in FSS using multi-cores and do the testing and analysis.
